Background and Purpose

Introduction

This report forms one of a suite of 16 individual needs assessments of the UK Overseas Territories (UKOTs) produced as part of the process of developing a DFID/FCO led cross HMG programme design to address climate change by promoting low carbon climate resilient development in the UKOTs. The purpose of this assignment was to identify the scope and best way to deliver an appropriate climate change programme for all UK OTs and develop a business case for it (contract duration Feb – June 2012).

The purpose of the reports was to provide a rapid synthesis of information contained within available documentation and frame this in a way which: helped to establish a clear rationale for a generic framework forming one business case for the UK OTs but not allowing this to exclude targeted and selective action to meet specific needs. They were also designed to provide an evidence base for the later comparative analysis across OTs and subsequent prioritisation of different approaches for the business case, which was going to be designed later in the consultancy.

It was agreed in May 2012 by the client and the consulting team that the contract was not fully deliverable as expressed in the original Terms of Reference. Details of the full programme of work and consultation is available in the project Inception Report (29th March 2012) and End of Contract Report (11th June 2012).

These reports now form a standalone output of the abbreviated consultancy.

The Reports

The original purpose of the reports still holds and the reader should recognise that the design and level of analysis in this report was set to be achievable within the time available (2 days of evidence gathering, research and writing against over 150 specific data points) and for the original purposes specified and no other. This report provides a general overview to facilitate future potential decision making and does not constitute a comprehensive nor in-depth analytical climate change report.

In a process facilitated by the UK Overseas Territories Association, data content in this report has been reviewed by in-country stakeholders via a nominated point of contact, with feedback incorporated if appropriate.

The report is tailored to the data points required to complete a climate change vulnerability matrix (VAM) tool. The VAM is structured around an understanding of four main issues: the exposure of an OT to climate change (threat analysis); adaptation and resilience; low carbon development and UK exposure. Each issue contains a number of subsets and indicators.

The completed VAM in this report uses a RAG colour coding system to provide a comparative analysis across all of the OTs to feed into the overall programme design. In most cases, data has been included specifically for the later appraisal and business case design process which would have followed.

Attached as annexes to this report are: an associated glossary of terms; a climate change VAM system definitions list; the VAM scoring system (which feeds into the coloured squares in the report text); the scored OT VAM; an initial programme approach table with preliminary sectoral and geographical analysis; and, if relevant, a greenhouse gas emission table.

Figure 1 overleaf illustrates how the data points in the VAM and in this report would have fed into the prioritisation process for a potential UKOT Climate Change Programme and DFID Business Case.

For a full understanding of how the data in this report and the VAM framework has been used, the reader is directed to the programme approaches which are elaborated in the programme Inception Report.

Needs Assessment: St Helena

Threat Exposure Analysis

Climate Change Exposure

Located in the South Atlantic over 4,000 miles from the UK, 700 miles southeast of Ascension Island and 1,700 miles from South Africa, the 47 square miles of the island of St Helena supports one of the most remote populations in the world. The climate is kept mild and equable by the southeast trade winds and temperatures range from 14-32 degrees centigrade in the summer and 14-26 degrees centigrade in winter. Rainfall is often extremely localised, creating desert-like conditions of the outer part of the island where 175mm of rain falls per year, compared to the Central Peaks area where cloud and mist accumulate bringing 290 days of overcast conditions and 1050mm of rain each year.

Metrological records for the period 1893-1999 indicate a drying trend with decreasing levels of precipitation (10mm/100 years), increasing air temperature (0.9°C/100 years) and decreasing air pressure (0.6hPa/100 years). Although two tropical storms developed in 2001 and 2004 in the South Atlantic, they are considered as atypical and isolated events.

This drying trend is expected to continue. Research points to a strong warming trend in air temperature (2°C in the next 60 years) and to increases in sea temperature, rises in sea level and a slight decrease in rainfall. Isolated storm events do not make it possible to predict clearly whether such extreme weather events will become the norm in the region in the future.

**Resource Exposure**

On St Helena electricity is generated through the use of diesel generators and wind turbines, with in excess of 10% of generation from wind. Diesel and petrol is imported and storage at the present is limited. According to the Public Works Department (now part of the Directorate of Infrastructure and Utilities), the saving in diesel fuel is approximately £150,000 a year. Electricity generated in 2009 was about 9 billion kWh and the main consumers were households.

St Helena’s water supply comes from natural springs and is collected in earth reservoirs or specially built storage tanks. The majority of the supply passes through carefully managed filtration systems before being distributed island wide for domestic, commercial and irrigation purposes via a piped network.

**Adaptation and Resilience**

**Importance to OT**

**Importance of System to OT**

**Natural Systems**: "Critical to both the sustainability of social development and economic growth is the effective management of the environment. The environment is one of the Island’s key selling points and is, therefore, a vital ingredient in the Island’s tourism offering, while also an important element of health and well-being for our residents” – St Helena Sustainable Development Plan 2012/13-2014/15. Biodiversity in St Helena is characterized by a high level of endemism. There are 43 endemic plants, 400 endemic invertebrates and more than a dozen endemic coastal fish species. Of 6 endemic terrestrial bird species that existed before human habitation, only the Saint Helena Plover (wirebird) (Charadrius sanctaehelena), an endemic terrestrial bird, has survived until today. The island’s natural heritage is the key to its future development. The new Land Development Control Plan identifies 23 National Conservation Areas and includes a suite of policies for the protection of the "Green Heartland" and other important areas in Coastal and Intermediate Zones. The diversity of the landscape is another of its outstanding features from semi desert on its coastal fringe, dry scrub on higher ground to cloud forest in the higher elevations of the Central Peaks. Like its terrestrial flora, the waters around St Helena are noted for high levels of endemic fish and marine organisms. A resident pod of pantropical spotted dolphins can be seen daily, while bottlenose dolphins are occasional visitors and humpbacked whales are periodically observed between June and December.

**Economic Systems**: Tourism, and to a lesser degree, fisheries and agriculture are key sectors of the island’s economy with potential for further development and expansion. St Helena’s economy is dependent upon British aid. A new airport is designed to facilitate a development strategy based on its tourism product which is partly described above.

---

Social Systems: In 2008 the enumerated census population of St Helena was 4,077 persons excluding 180 persons who were on board the RMS St Helena and on yachts in the harbour; a decline of 1,001 persons since 1998. This decline is attributed to a falling birth rate, continued outward migration, increased contract work opportunities in the Falkland Islands and the restoration of British Citizenship. The population is also experiencing an increase in the proportion of the elderly from 11.3% in 1998 to 17.8% in 2008. Life expectancy is 70.8 years for males and 77.3 years for females and the mortality rate is 5 deaths per 1,000 live births. In 2009/10 per-capita GDP was $3,875 in 2009/2010.

Vulnerability

Sensitivity to Climate Exposure

Natural Systems: Saint Helena’s natural systems have been ravaged by alien invasive species, three endemic seabirds and five endemic landbirds have been lost and the native vegetation has been destroyed in most places by a combination of soil erosion caused by over-grazing by introduced herbivores, and the spread of invasive plants. Changes in climate may favour invasive flora and fauna over endemic and resident species. The decrease in rainfall could have implications for local water supplies on St Helena. Variations in precipitation are also likely to accelerate erosion on the eastern side of St Helena.

Economic Systems: The majority of SHG Government buildings and private sector enterprise are located within the narrow confines of the James Valley. The underlying geological conditions in the valley make it particularly vulnerable to rockfall and landslides. Most recently in August 2008, approximately 300 tonnes of rock fell in Jamestown resulting in significant damage to the Baptist Church and adjacent properties, the closure of Ladder Hill Road for several days and the evacuation of pupils from the Pilling primary school. Although there has been extensive rockfall protection works (funded by DFID) the risk remains. Rainfall induced rockfall and landslides events remain a common occurrence, affecting roads and property. James town and other parts of the island also have a history of inland flooding caused by heavy rainfall events. Any potential drying trend could lead to water stress and effects on the viability of the tourism economy that the island is seeking to develop. The fishing industry may also be affected by changes in sea surface temperatures, but these potential effects are not well understood. The wharf at Jamestown and sea front at Ruperts Bay may be affected by changes to ocean swell and any potential increase in the intensity of storms. The construction of an airport is expected to mitigate the effects of heavy sea conditions which would affect passenger disembarkation from the RMS St Helena and cruise ships. Social Systems: Any significant rockfall event that breaches the existing protection measures will affect the resident population of the James Valley. Any potential pressure on water supply will have implications for the entire island and the viability of the population.

23 St Helena Government (2010): “Jamestown Rockfall Protection Environmental Assessment Phase 1 and Phase 2 EMP” – produced by WSP International for SHG
Current Resilience Activities

Resilience activities in St Helena comprise a range of recent and on-going infrastructure interventions based around the action plan and prioritised projects outlined within the St Helena Infrastructure Plan\(^\text{28}\) and on a wide range of conservation based initiatives which can be seen as part of a wider ecosystems-based approach to adaptation.

On infrastructure: Water projects W1 (design and support to sustainable water resources management) and W2/3 (water meeting immediate needs) are increasing the institutional management capability, reducing water loss and improving the physical distribution of water between catchments\(^\text{29}\); similar projects are being instigated in roads which will reduce the susceptibility of the road network to weather effects through improved maintenance. In social services the hospital is being upgraded\(^\text{30}\). An on-going scheme entitled the Wharf Improvement Project funded by the EU under EDF9 and EDF10 commenced in 2009 with a cliff stabilisation project to mitigate rockfall into the wharf area. Further works have included widening and strengthening of sections of the wharf, including the use of rock armouring.\(^\text{32}\)

Not in the plan, but with major implications for St Helena, in 2010 DFID funded the first phase of rockfall protection works – a programme of rock catch fences and nets on the eastern and western slopes of the James Valley\(^\text{33-34}\).

On conservation, the new Land Development Control Plan identifies 23 areas to be included in a national network of protected areas while strict planning policies are in place governing development in the "Green Heartland". DFID, the FCO and DEFRA have all been heavily involved in conservation programmes, generally working closely through the national trust. Examples of recent initiatives include Laying the Foundations for Invertebrate Conservation on St Helena and Mapping St Helena’s Marine Biodiversity to create a Marine Management Plan (both under the Darwin initiative) and the Bastard Gumwood Recovery Project and Invasive Species Project partially funded by DEFRA and coordinated by JNCC.\(^\text{35, 36}\)

Work continues on the Millennium Forest – a community participation project for the re-creation of the former great Wood lowland gumwood forest. The implementation of a restoration management plan for Diana’s Peak National park is also ongoing, enhancing and restoring this area of native cloud forest\(^\text{37}\).

St Helena also hosts two Important Bird Areas (IBAs) and three sites have been proposed to be designated as Ramsar sites.\(^\text{38}\)

Activities in the field of energy supply and use are reported in Current Abatement Activities.

Exacerbating Stresses

It is anticipated that a new airport and supporting policy and programme framework will overcome key stresses which relate to its isolation.

St Helena’s greatest challenge is rebuilding its skill base following massive depopulation in the 1990s. SHG still relies heavily on technical assistance\(^\text{39}\). The remoteness of the island affects both population levels and the ability of HMG to respond to the effects of any natural disaster.

\(^{28}\) SHG and DFID (2008) "Infrastructure Plan" produced by the DFID Resource Centre TI-UP 2008
\(^{29}\) SHG and DFID (2008) "Infrastructure Plan" produced by the DFID Resource Centre TI-UP 2008
\(^{30}\) ibid
\(^{31}\) SHG Directorate of Infrastructure and Utilities (2012): “Terms of Reference for the provision of Project Management Support Contractor” – issued by DIU July 2012
\(^{38}\) SHG and DFID (2008) "Infrastructure Plan" produced by the DFID Resource Centre TI-UP 2008
Challenges exist for biodiversity conservation on the island, including the introduction of invasive non-native species and illegal fishing.\(^{40}\)

A potential rapid increase in population (resident and tourist) arising from airport development may exacerbate land use pressure and pressure on scarce water and energy resources.

**Future Opportunities**

**Potential Adaptation Interventions**

In infrastructure the St Helena Infrastructure Plan contains a number of potential project interventions in Water and Roads to improve the management of these assets\(^{41}\).

The *Strategic Plan for the Environmental Management Department 2012-15* includes the development of management plans for all the NCA identified in the LDCPs and to start implementing 3 of them in priority areas. A range of opportunities exist within this framework to implement species conservation and management of invasive species. For example, the St Helena National Trust has also recently been awarded with nearly £300,000 from the Darwin Initiative for a three year programme to 'Increase local capacity to conserve St Helena’s threatened native biodiversity', and more specifically to halt biodiversity loss in the species-rich High Peak and Blue Point areas on St Helena, through increasing local awareness to deliver practical habitat restoration and management. The development of eco-tourism activities is also part of the project.\(^{42}\)

The Strategic Plan also commits to the implementation of a project on solid waste management.\(^{43}\)

**Implementation Capacity**

The St Helena Government launched an Environmental Management Directorate on 16 April 2012. Its focus will be to mainstream environment and climate change within St Helena Government.\(^{44}\) In April 2012 the Department was advertising for an Environmental Risk Manager and a Climate Change and Pollution Officer to develop its resilience capacity. Other government directorates, notably the Infrastructure and Utilities Directorate are overcoming problems relating to local recruitment with DFID sponsored TA. Historic problems of recruiting through this mechanism may be overcome by the advent of air access.

The St Helena National Trust is responsible for the protection, enhancement and promotion of St Helena’s unique environmental and cultural heritage. It has recently been awarded with nearly £300,000 from the Darwin Initiative for a three year programme to 'Increase local capacity to conserve St Helena’s threatened native biodiversity'.\(^{45}\) The Trust is, however, heavily dependent on the commitment and passion of a small number of resident

---

\(^{41}\) SHG and DFID (2008) "*Infrastructure Plan*" produced by the DFID Resource Centre TI-UP 2008

Low Carbon Development (Source)

Current Emissions

Share of Current Emissions
St Helena is not covered by UK GHG Inventory. Estimates suggest that St Helena was responsible for the production of 11,000 metric tonnes CO₂ in 2008. 46

GHG Abatement

Abatement Potential
The St Helena Government is committed to investing in the use of more renewable energy and promoting energy conservation. St Helena has an excellent wind energy resource, with high average windspeeds, but low extreme gust speeds. Despite some operational problems the existing Lagerwey wind turbines on Deadwood Plain have demonstrated the value of this resource. St Helena has already achieved very high levels of wind power contribution to power demand in comparison with mainland utilities. Wind power technology is well-established world-wide, and the Energy Division of the Infrastructure and Utilities Directorate has already gained experience of operating wind turbines. For these reasons, wind power is considered to be a suitable renewable technology for further application on St Helena47. The primary difficulty in expanding the island’s wind generation capacity lies in finding suitable sites on the island. The island’s complex geography means that many sites around the island may not be suitable for wind generation, due to difficulties of access for installation and maintenance, and also due to the turbulence generated within the approaching airflow by the terrain. The number of sites available for wind generation may be further limited by existing development, the proposed airport, and by environmental considerations48.

Although, solar water heaters are common, the full potential of this resource is unknown.

Current Abatement Activities
In St Helena Electricity is generated through the use of diesel generators and wind turbines, with in excess of 10% of generation from wind.49 Three wind turbines contributed up to 240 kW to the total demand for electricity. The saving in diesel fuel is approximately £150,000 a year.50 The Power System in St Helena is currently being upgraded with DFID funding to include the potential to integrate further renewables. The 2009 St Helena Infrastructure Plan51 included a number of potential projects, including additional wind generating capacity. In the long term this may include energy storage.

Moreover, the Government of St Helena has recently supplied households with free energy saving bulbs. Solar powered street lighting has recently started to be implemented and solar water heaters are becoming more common.52

47DFID TI-UP (2010) “Environmental Screening Note for additional wind turbines on St Helena” produced by and submitted by the Department of Energy, Infrastructure and Utilities Directorate, 2010
48Ibid
51SHG and DFID (2008) "Infrastructure Plan" produced by the DFID Resource Centre TI-UP 2008
Future Opportunities

Potential LCD Intervention

SHG has been actively investigating alternative potential energy sources. This includes most recently a study investigating the potential for hydropower. In the short and medium term, potential interventions are likely to be restricted to further wind energy and use of solar energy for hot water.

Activities planned in the fields of tourism, waste management, land use and forestry have already been reported in 'Potential Adaptation Interventions.'

Implementation Capacity

The production and distribution of electricity falls under the auspices of the Directorate of Infrastructure and Utilities (formally Public Works and Services Department).

NAO (2007) reported that there were difficulties in attracting suitably qualified applicants for senior permanent posts in these Territories. It is anticipated that the advent of air access will mitigate this issue.

UK Exposure

UK Sunk Assets

DFID initiated a major project for the construction of an airport in 2011, which will be operational towards the end of 2015. The UK is providing up to £246.6 million to build this airport. Economically, St Helena is still dependent upon British aid.

Absolute Value of UK Transfer

Economically, St Helena is dependent upon British aid. DFID averaged £23.5 million a year over three years from 2009/2010 to 2011/2012 to support St Helena. A small percentage of the Technical Cooperation Budget was spent on providing technical assistance to Tristan da Cunha.

Share of National Budget from UK Transfer

More than 50% of the budget is provided by the UK Government.

Potential Liability

St Helena is an ODA eligible country and the UK is responsible for picking up the end costs of any natural disaster/extreme weather event. Moreover, UK HMG has an on-going responsibility for the support of essential government services.

St Helena is among the signatories of the following multilateral environmental agreements:

57 ibid
- Convention on Biological Diversity (CBD)
- Convention on the Conservation of Migratory Species of Wild Animals (CMS)
- African-Eurasian Migratory Waterbird Agreement (AEWA)
- Agreement on the Conservation of Albatrosses and Petrels (ACAP)
- Ramsar Convention on Wetlands of International Importance
- Vienna Convention for the Protection of the Ozone Layer

**Reputational Risks**

DFID funded evidence suggests that the island has been suffering economic and social decline, with increasing levels of outwards migration and the average annual salary decreasing to just £4,000.¹¹ St Helena is still dependent on UK aid.¹²

---

¹² Note that air access and the memorandum of understanding signed between HMG and SHG as part of that process is designed to reverse the outward migratory trend and place St Helena on the path to sustainable development.
Annex One: UKOT Climate Change Vulnerability Analysis Matrix
Glossary of Terms
# UKOT Climate Change Vulnerability Analysis Matrix Glossary of Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abatement Potential</td>
<td>(Cost effective) technical potential for reducing emissions within sector.</td>
</tr>
<tr>
<td>Absolute GHG Emissions</td>
<td>Annual amount of greenhouse gases (GHG) produced by an Overseas Territory. It is measured as metric tonnes of CO₂ generated per year.</td>
</tr>
<tr>
<td>Absolute Value of UK Transfer</td>
<td>Total amount of funding from UK to an Overseas Territory per year.</td>
</tr>
<tr>
<td>Adaptation</td>
<td>The extent to which existing initiatives and measures (projects and programmes) are expected to reduce the vulnerability of natural and human systems against actual or expected climate change effects.</td>
</tr>
<tr>
<td>Adaptive Capacity</td>
<td>The ability of a social or natural system to absorb disturbances while retaining the same basic structure and ways of functioning, the capacity for self-organisation, and the capacity to adapt to stress and change.</td>
</tr>
<tr>
<td>Carbon sink</td>
<td>A natural or artificial reservoir that accumulates and stores some carbon-containing chemical compound for an indefinite period. Natural: Absorption of carbon dioxide by the oceans via physicochemical and biological processes and photosynthesis by terrestrial plants. Artificial: include landfill and carbon capture and storage.</td>
</tr>
<tr>
<td>Climate Change</td>
<td>A change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods.</td>
</tr>
<tr>
<td>Climate Change Impact</td>
<td>Consequences of climate change on social, economic and natural systems without considering adaptation.</td>
</tr>
<tr>
<td>Climate Change Exposure</td>
<td>The change in climate with a potential adverse effect on social, economic and natural systems.</td>
</tr>
<tr>
<td>Current Abatement Activities</td>
<td>Any action that reduces the emissions or emissions intensity (per unit output) of a given sector on-going or completed in UK Overseas Territories as of March 2012.</td>
</tr>
<tr>
<td>Current Resilience Activities</td>
<td>Resilience activities on-going or completed in UK Overseas Territories as of March 2012.</td>
</tr>
<tr>
<td>Energy Efficiency</td>
<td>Ratio of energy output of a conversion process or of a system to its energy input: measures taken to reduce demand for energy for the same projected level of development.</td>
</tr>
<tr>
<td>Energy Import Dependence</td>
<td>Percentage of energy imported from abroad by the single Overseas Territory.</td>
</tr>
<tr>
<td>Exacerbating Stresses</td>
<td>Natural or human factors which in isolation or combination have the potential to lead to a change in the severity or frequency of a climate change threat. This may include inter alia a natural hazard, an extreme weather event, social tension or conflict, demographic trends and population characteristics and institutional and/or societal capacity constraints.</td>
</tr>
<tr>
<td>Exposure</td>
<td>The sum of the character, magnitude and rate of climate change variation to which a system is influenced by.</td>
</tr>
<tr>
<td>Fossil Fuel Dependence</td>
<td>The percentage of total fuel consumption derived from carbon-based fuels from fossil carbon deposits (including coal, oil, and natural gas) and the percentage of that fuel that is imported.</td>
</tr>
<tr>
<td>Frequency and Severity</td>
<td>Occurrence and magnitude of an event in UK Overseas Territories.</td>
</tr>
<tr>
<td>Future Opportunities</td>
<td>A territory’s ability to reduce greenhouse gas emissions or to enhance carbon sink (Potential LCD Intervention) coupled with its potential to plan adjustment interventions in response to the effects of climate change (Potential Adaptation Intervention).</td>
</tr>
<tr>
<td>GHG Abatement (Current)</td>
<td>Potential for reducing emissions within sector coupled with any action already in place that reduces the emissions or emissions intensity of a given sector.</td>
</tr>
</tbody>
</table>
**Implementation Capacity**
Current (March 2012) capacity to design, implement and monitor all related low carbon / adaptive capacity activities. This includes all current resource constraints (i.e. funding, local personnel capacity, lack of personnel, supportive infrastructure etc.) and opportunities.

**Importance of system to OT**
The value that society and people in an UK Overseas Territory place on the significance of impacts and vulnerabilities (see Vulnerability) on social, economic and natural systems.

**Low Carbon Development (Source)**
Actions which include making a contribution towards stabilising levels of CO₂ and other greenhouse gases at a level that will avoid dangerous climate change, through cuts in emissions, demonstrate a high level of energy efficiency, use low-carbon energy sources and/or utilise and enhance carbon sinks.

**Magnitude**
The area or number of people likely to be affected as a proportion of total population or land area.

**Potential Liability**
Legal, Financial, Moral and Political exposure arising from the activities of the UK Overseas Territories. This includes UK commitments to legal treaties that extend to the OTs (e.g. European Convention on Human Rights) and response to natural and man-made disasters and terrorist events.

**Potential LCD Intervention**
A territory’s ability to reduce anthropogenic CO₂ and other greenhouse gas emissions or to enhance carbon sinks, where ability refers to skills, competencies, fitness and proficiencies that a territory has attained and depends on technology, institutions, wealth, equity, infrastructure and information.

**Potential Adaptation Interventions**
The potential for a planned intervention which constitutes or contributes to an adjustment in natural, social or economic systems in response to actual or expected climatic stimuli or their effects, which moderates harm or exploits beneficial opportunities.

**Reputational Risk**
Reputation is defined as the social evaluation of the public towards HMG. Risk is the probability that a failure to act will produce harm to that reputation. This reputation may be defined in terms of the potential: loss of HMG ethical (moral) reputation for safe guardianship of its citizens) disruption or distortion of HMG relationship with its citizens in the OTs withdrawal of private sector investment in UK Overseas Territories (investor flight).

**Resilience**
The ability of a social or natural system to absorb disturbances while retaining the same basic structure and ways of functioning, the capacity for self-organisation, and the capacity to adapt to stress and change.

**Resource Exposure**
Degree at which a system is influenced by a variation in the availability or the price of resources (specifically water and energy).

**Resource Use Efficiency**
The effective use of energy and water resources – limiting wastage and maximising usable resources.

**Sensitivity to Climate Exposure**
Affects the magnitude and/or rate of a climate related perturbation or stress and is the degree to which a system [exposure unit] is affected, either adversely or beneficially, by climate variability or climate change. The effect may be direct (e.g. a change in crop yield in response to a change in the mean, range, or variability of temperature) or indirect (e.g., damages caused by an increase in the frequency of coastal flooding due to sea level rise).

**Share of Current Emissions**
Percentage of OT’s Absolute GHG Emissions generated by each sector.

**Share of National Budget from UK Transfer**
Percentage and amount (at 2011 prices) of the total Overseas Territory Budget which comes from HMG budgetary support.

**System (Social, Economic and Natural)**
A set of functionally inter-related elements subdivided into Natural (ecosystems and biodiversity) and Social and Economic (Human) elements.

**Threat Exposure Analysis**
Identification of the threats that may affect a system and evaluation of their frequency and severity.

**UK Exposure**
Risk to the UK arising from activities in the UK Overseas Territories. It includes UK Sunk Assets, Share of National Budget from UK Transfer, Potential Liability and Reputational Risk.
UK Sunk Assets: UK investments in physical infrastructure in the Overseas Territories which cannot be recovered.

**Vulnerability**: The degree to which a system is susceptible to, and unable to cope with, adverse effects of climate change, including climate variability and extremes. Vulnerability is a function of the character, magnitude, and rate of climate change and variation to which a system is exposed, its sensitivity, and its adaptive capacity.

Annex Two: UKOT Climate Change VAM Systems Definition
### Social, Economic and Natural Systems Definitions

| Biodiversity and Ecosystems (Marine and terrestrial) | **Ecosystems** – A community of living (plants and animals) and non-living things (climate, landscape) which interact together and affect each other.  
**Biodiversity** – The variety of plant and animal life found in an ecosystem and the variation in their genetic makeup. It is a measure of the health of an ecosystem, with healthy ecosystems having greater variety and variation in plant and animal life than unhealthy ones.  
*Source: Brown, 2008* |
| --- | --- |
| Hydrology and Water resources | **Hydrology** - The various systems that are involved in the hydrological cycle (water evaporation, atmospheric circulation of water vapour, cloud formation, precipitation, interception by plant life, land surface runoff, soil infiltrations, groundwater recharge, discharge into streams etc).  
**Water resources** – The availability of useful water, often a limiting factor for social and economic development. Sources include groundwater, rainwater and surface reservoirs or rivers.  
*Source: Gray, 2010*; *Parry et al., 2007* |
| **Tourism** | Comprises the activities of persons traveling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purpose  
*Source: UNWTO, 2011* |
| **Transportation** | A system of conveying people, goods, etc., from one place to another.  
The definition includes water, air, and land transport. |
| **Agriculture and Fisheries** | **Agriculture**– The science or practise of cultivating the soil and rearing animals  
**Fisheries** – The occupation of catching or rearing fish |
| **Forestry** | All economic activities that mostly depend on the production of goods and services from forests including commercial activities that are dependent on the production of wood fibre. It also includes activities such as the commercial production and processing of non-wood forest products and the subsistence use of forest products  
*Source: FAO, 2004* |
| **Energy Supply and Use** | **Energy supply** – Extraction, conversion, and transportation of fuels and electricity to ultimate end use  
**Energy use** - The amount of fuels and electricity utilized during a period of time to provide a useful service such as heating, cooling, or transportation  
*Source: Wilbanks et al., 2008* |
| **Industry and Commerce** | **Industry** - Industry includes manufacturing, mining, construction and related informal production activities. Other categories, such as transport, energy supply & demand and processing of forest products have been included in other sectors.  
**Commerce** – Commerce is the exchange or buying and selling of commodities. In our definition it includes trade, retail and other commercial activities. |
| **Human Health** | Human health includes physical, social and psychological well-being.  
**Society** – Society includes *infrastructures, human settlements* and *social issues*.  
*Infrastructures* are systems designed to meet relatively general human needs, often through largely or entirely public utility-type institutions. Infrastructures for settlements and society include both ‘physical’ (sanitation and communication systems) and ‘institutional’ (shelter, health care, food supply, security and fire services and other forms of emergency protection). *Human settlements* comprise physical capital (buildings) where most of the world’s population live. *Social issues* include all the factors relating to human society and its members, concerning the way of life of the local population (livelihoods and welfare).  
*Source: Parry et al., 2007* |
HDI (Human Development Index) - A summary composite index that measures a country's average achievements in three basic aspects of human development: longevity, knowledge, and a decent standard of living.

Livelihoods - A livelihood comprises the capabilities, assets (including both material and social resources) and activities required for a means of living.

Poverty – A state or condition in which a person or community lacks the financial resources and essentials to enjoy a minimum standard of life and well-being that is considered acceptable in society.

Source: Chambers and Conway, 1991

Note: The sectors considered as potential sources of greenhouse gases in the Low Carbon Development section are the ones reported by Department of Energy and Climate Change, 2009.

Annex Four: St Helena - Scored VAM
St Helena

Summary

St Helena

ENVIRONMENT: The island of St Helena forms a single grouping with Tristan da Cunha and Ascension Island under the Crown. Located in the South Atlantic Ocean, St Helena covers 122 km². Total population around 4,000 people. Main economic activities include tourism, fisheries and agriculture. Major plans to scale up limited touristic activities on St Helena with ongoing construction of airport.

Threat Exposure Analysis

Experienced events: air temperatures have increased by 0.9°C in last 100 years; decrease of monthly rainfall (10mm/100 years); decreased air pressure (0.6hPa/100 years). Expected events: air temperatures to increase by 2°C in the next 60 years; rainfall to decrease; sea surface temperatures and sea level to increase. Electricity produced through diesel generators and wind turbines. Water supply from local natural springs in St Helena.

Adaptation and Resilience

Systems: Presence of endemic species of flora and fauna. Tourism, fisheries and agriculture key sectors of economy with potential for expansion. Per-capita GDP of $3,875 and life expectancy of 77.3 years (women). Predicted effects: spread of invasive species accelerated by warmer temperatures. Decreased rainfall to affect groundwater sources. Variations in precipitation likely to accelerate erosion. Likely decrease in fishery; tourism affected by worsened weather pattern. Decreased fishery; tourism affected by worsened weather pattern.

Low Carbon Electricity Resource Potential

CO2 emissions: 11,000 metric tonnes in 2008. Three wind turbines supplying 10% of electricity.

UK Exposure

St Helena dependent upon budgetary aid from UK. UK still responsible for essential government services. Major project for building an airport. £23.5 million (more than 50% of St Helena budget) a year allocated for three years from 2009/2010 to 2011/2012. St Helena signatory of several multilateral environmental agreements.

Exacerbating Risks

Volcanic origin; Introduction of invasive non-native species; Illegal Fishing; Erosion

Additional Potential Classification

High

High levels of cost effective technical potential identified, with strong evidence of associated planning and investment

Medium

Medium cost effective resource potential identified, with medium evidence of associated planning and investment

Low

Low cost effective technical potential identified, with limited evidence of associated planning and investment

None

No cost effective technical potential identified.

None

No cost effective technical potential identified.
